05 – Archiving, Chaining, Piping & Redirection

CS 2043: Unix Tools and Scripting, Spring 2019 [2]

Matthew Milano

February 1, 2019

Cornell University

Table of Contents

- 1. File Compression
- 2. Assorted Commands
- 3. Chaining Commands
- 4. Piping & Redirection

File Compression

Making Archives: Zip

Package and Compress (Archive) Files

zip <name_of_archive> <files_to_include>

- E.g. zip files.zip a.txt b.txt c.txt
- Extracts to a.txt, b.txt, and c.txt in current directory.
- To do folders, you need recursion.
 - zip -r folder.zip my_files/
 - Extracts to folder named my_files in current directory.
 - Good practice to ALWAYS zip a folder and distribute with the name it will extract as.
 - zip -r folder_name.zip folder_name/
 - Drives me *crazy* when I get a .zip that extracts files in the same directory... very difficult to keep track of.

List, Test and Extract Compressed Files in a zip Archive

unzip <archive name>

- Use 1 to list what would extract before doing it.
- **Note**: The original files DO stay intact.

Making Archives: Gzip

GNU zip

gzip <files_to_compress>

- Less time to compress, larger file: --fast
- More time to compress, smaller file: --best
- Read the man page, lots of options.
- By default, replaces the original files!
 - You can use --keep to bypass this.

GNU unzip

gunzip <archive name>

- Use -l to list what would extract before doing it.

Notes:

- · Does not bundle the files.
- · Reiterate: replaces original by default.
- · Usually has better compression than **zip**.

Additional Archive Formats

- This is a non-exhaustive list. There are **many** out there.
- Similar interface to gzip:
 - bzip2: "Burrows-Wheeler block sorting compression algorithm"
 - xz: "x"-zip, uses LZMA compression scheme (good)
- · Honorable mentions:
 - file.rar: a "RAR" archive; used for distributing large files
 - file.rar.001, file.rar.002, etc: multiple archives needed to reconstruct whole.
 - · You extract the first one, it looks for the others in same directory.
 - file.7z: "7"-zip, successor to RAR, uses LZMA
 - If you are choosing between .rar and .7z...choose .7z.
 - · Install unrar to deal with these on Unix.
- Moral:
 - Working with tar and/or only Unix? Use xz.
 - · Have to support Windows fools? **Use 7zip**.

Making Archives: Tar

Bundling files together to compress is easy!

Tape archive

tar -cf <tar_archive_name> <files_to_compress>

- Create a tar archive.

tar -xf <tar_archive_name>

- Extract all files from archive.
- tar is a stream tool. By default, it is expecting stream input.
- Don't forget the **-f** if you are working with files!
- Notes:
 - tar is just a bundling suite, creating a single file.
 - By default, it does *not* compress.
 - · Original files DO stay in tact.
 - Unlike **zip**, you do not need the **-r** flag for folders :)

Making Archives: Tarballs

Making tarballs

```
tar -c[zjJ]f <archive_name> <source_files>
tar -x[zjJ]f <archive_name>
```

- [zjJ] here means either z, j, or J only one.
- YOU have to specify the file extension.
- Use gzip compression method: -z (or --gzip)
 - Extension convention: .tar.gz
 - Example: tar -czf files.tar.gz files/
- Use bzip2 compression method: -j (or --bzip2)
 - Extension convention: .tar.bz2
 - Example: tar -cjf files.tar.bz2 files/
- Use xz compression method: -J (or --xz)
 - Extension convention: .tar.xz
 - Example: tar -cJf files.tar.xz files/

Pro Tip: Minimize your Keystrokes

- Extraction can usually happen automatically:
 - tar -xf files.tar.gz will usually work (no -z)
 - · Best results when:
 - · You are obeying filename conventions.
 - tar made the archive in the first place.
- Compression: no, you have to tell it what to do...
- It's the flag equivalent of the **tab** key.
 - · Ok, maybe not...but just remember it!
 - This serves as a not-so-subtle reminder to obsessively hit your tab key;)

Assorted Commands

Before we can Chain...

...we need some more interesting tools to chain together!

Counting

Ever wanted to show off how cool you are?

Word Count

```
wc [options] <file>
```

- count the number of lines: l
- count the number of words: -w
- count the number of characters: -m
- count the number of bytes: -c
- · Great for things like:
 - · Reveling in the number of lines you have programmed.
 - Analyzing the verbosity of your personal statement.
 - Showing people how cool you are.
 - Completing homework assignments?

Sorting

Sort Lines of Text

sort [options] <file>

- Default: sort by the **ASCII** code (*roughly* alphabetical, see [1]) for the whole line.
- Use r to reverse the order.
- Use -n to sort by numerical order.
- Use -u to remove duplicates.
- · Working with the demo file peeps.txt:

\$ cat peeps.txt
Manson, Charles
Bundy, Ted
Bundy, Jed
Nevs, Sven
Nevs, Sven

\$ sort -r peeps.txt
Nevs, Sven
Nevs, Sven
Manson, Charles
Bundy, Ted
Bundy, Jed

\$ sort -ru peeps.txt
Nevs, Sven
Manson, Charles
Bundy, Ted
Bundy, Jed
only 1 Nevs, Sven

Advanced Sorting: Why?

• The **sort** command is quite powerful, for example you can do:

- Sorts the file numerically by using the *third* column, separating by a comma as the delimiter instead of whitespace.
- Read the man page!
- Learning **sort** command is particularly worth your time:
 - \cdot Easy sorting of text \Longrightarrow faster parsing / prototyping.
 - Many commands produce reliably ordered output.
 - · Looking for a specific thing? Just sort with that as the key!
 - E.g. grep -Hn \Longrightarrow use the : as your delimiter.
 - · We'll learn grep soon!

Advanced Sorting: Example

The demo file numbers.txt contains:

```
$ cat numbers.txt
  02, there, 05
  04. how . 03
  01, hi, 06
  06, you, 01
  03, bob, 04
  05, are, 02
# Normal numeric sort
                                  # On the third column
$ sort -n numbers.txt
                                  $ sort -n -k 3 -t ", " numbers.txt
01, hi, 06
                                  06, you, 01
02, there, 05
                                  05.are.02
03, bob, 04
                                  04, how, 03
04.how.03
                                  03.bob.04
05, are, 02
                                  02, there, 05
06, you, 01
                                  01.hi.06
```

• Reverse ordering in 3rd column not necessary, just an example.

Special Snowflakes

Unique — Report or Omit Repeated Lines

uniq [options] <file>

- No flags: discards all but one of successive identical lines.
 - Unique occurrences are merged into the first occurence.
- Use -c to prints the number of successive identical lines next to each line.
- Use -d to only print repeated lines.

Search and Replace

Translate characters / sets (but not regular expressions) easily!

Translate or Delete Characters (or Sets)

tr [options] <set1> [set2]

- Translate or delete characters / sets.
 - We will cover POSIX / custom sets soon.
- By default, searches for strings matching **set1** and replaces them with **set2**.
- If using -d to delete, only **set1** is specified.
- Can use -c to invert (complement) the set.
- The tr command only works with streams.
- Examples to come after we learn about chaining commands in the next section.

Chaining Commands

Your Environment and Variables

- There are various environment variables defined for your shell.
- They are almost always all capital letters.
- · You obtain their value by dereferencing them with a \$.

```
$ echo $PWD  # present working directory
$ echo $OLDPWD # print previous working directory
$ printenv  # print all environment variables
```

- There are also local variables you can use / set.
- · Primary difference:
 - Environment variables are available in your shell, and in scripts.
 - · Local variables are only available in your shell.
 - · "Shell" here just means "current terminal session."

What is Defined?

- · The environment:
 - env: displays all environment variables.
 - unsetenv <var_name>: remove an environment variable.
 - · Create an environment variable*:
 - 1. env ENV VAR NAME="value"
 - 2. export ENV_VAR_NAME="value"
 - export is the most common. Exceptional explanation here.
- · The local variables:
 - set: displays all shell / local variables.
 - unset <var_name>: remove a local shell variable.
 - · Create a local variable*:
 - 1. set local_var="value"
 - 2. local var="value"
- * These only last for the current shell session; we will learn how to make them "permanent" soon.

Brief Example: Environment Variable Manipulation

```
# MY ENV VAR is not set yet, so nothing prints
$ echo "My env var is: $MY ENV VAR"
My env var is:
# Set the environment variable (can also use `export` in bash)
$ env MY ENV VAR="Lemming King"
# Now that we have set it, print it
$ echo "My env var is: $MY ENV VAR"
My env var is: Lemming King
# "Delete" with `unsetenv`. Print again, confirming it's gone
# Emphasis: there *is* an `env` after `unset`
$ unsetenv MY ENV VAR
$ echo "My env var is: $MY ENV VAR"
My env var is:
```

Brief Example: Local Variable Manipulation

```
# my local var is not set yet, so nothing prints
$ echo "My local var is: $my local var"
My local var is:
# Just declare it (can also use the `set` command)
$ my local var="King of the Lemmings"
# Now that we have set it, print it
$ echo "My local var is: $my local var"
My local var is: King of the Lemmings
# "Delete" with `unset`. Print again, confirming it's gone
# Emphasis: there is *not* an `env` after `unset`
$ unset my local var
$ echo "My local var is: $my local var"
My local var is:
```

Exit Codes

- · When you execute commands, they have an "exit code".
 - This how you "signal" to others in the shell: through exit codes.
- The exit code of the last command executed is stored in \$?
- There are various exit codes, here are a few examples:

```
$ super_awesome_command
bash: super_awesome_command: command not found...
$ echo $?
127
$ echo "What is the exit code we want?"
What is the exit code we want?
$ echo $?
0
```

- The success code we want is actually **0**. Refer to [3].
- Remember that cat /dev/urandom trickery? You will have to ctrl+c to kill it, what would the exit code be?

Executing Multiple Commands in a Row

- With exit codes, we can define some simple rules to chain commands together:
- · Always execute:

```
$ cmd1; cmd2 # exec cmd1 first, then cmd2
```

• Execute conditioned upon exit code of cmd1:

```
$ cmd1 && cmd2 # exec cmd2 only if cmd1 returned 0
$ cmd1 || cmd2 # exec cmd2 only if cmd1 returned NOT 0
```

 Kind of backwards, in terms of what means continue for and, but that was likely easier to implement since there is only one
 and many not 0's.

Piping & Redirection

Piping Commands

 Bash scripting is all about combining simple commands together to do more powerful things. This is accomplished using the "pipe" character.

Piping

<command1> | <command2>

- Pass output from command1 as input to command2.
- Works for almost every command.
 - Note: echo does not allow you to pipe to it!
- In some senses, the majority of commands you will learn in this course were designed to support this.

Some Piping Examples

• 1, 2, 3...easy as ABC?

Piping along...

- \$ ls -al /bin | less
- Scroll through the long list of programs in /bin
- \$ history | tail -20 | head -10
- The 10th 19th most recent commands executed.
- \$ echo * | tr ' ' '\n'
- Replaces all spaces characters with new lines.
- Execute just **echo** * to see the difference.
- In all of these examples, try executing it first without the |
 - First: execute history
 - Next: execute history | tail -20
 - · Last: execute history | tail -20 | head -10

Redirection

- The redirection operators are: >, >>, <, or <<.
 - To redirect standard output, use the > operator.
 - · command > file
 - To redirect standard input, use the < operator.
 - · command < file
 - To redirect standard error, use the > operator and specify the stream number 2.
 - · command 2> file
 - Combine streams together by using **2>&1** syntax.
 - · This says: send standard error to where standard output is going.
 - Useful for debugging / catching error messages...
 - · ...or ignoring them (you will often see that sent to /dev/null).

Redirection Example

• Bash processes I/O redirection from left to right, allowing us to do fun things like this:

Magic

```
tr -dc '0-9' < test1.txt > test2.txt
```

- Deletes everything but the numbers from test1.txt, then store them in test2.txt.
- CAUTION: do not ever use the same file as output that was input.
 - Example: tr -dc '0-9' < original.txt > original.txt
 - You will *lose* all your data, you cannot read and write this way.
- Piping and Redirection are quite sophisticated, please refer to the Wikipedia page in [4].
- · Hands-on examples in the lecture demo.
